The most consistent weather trader I've tracked on Polymarket - and I've been stress-testing what actually drives these markets

+ \$27,500 since February - 89% win rate over 1,300+ trades - Mainland China weather

Profile: <https://polymarket.com/@vip68?via=pavlo-ys0z> ...

Edge → grinding near-certain mispricings, not lottery tickets

Most buys are "Yes" on temperature bands the forecast already makes ~85-90% likely, picked up at 20-30¢ - below true odds

Where the money came from:

\$939 → \$3,111 - [Shanghai 27°C+, Apr 6] - Yes at 28¢ \$359 → \$1,636 - [Chongqing 27°C, Apr 30] - Yes at 19¢ \$29 → \$815 - [Shanghai 29°C, Apr 27] - Yes at 2.6¢

Not one thing - it grinds the near-locks for the base, then mixes in cheap longshots for the convex upside

Monthly hit rate - Mar 97%, Apr 93%, May 97%

Trades cluster 4am-12pm UTC - midday to evening in China, exactly when each city's daily high locks in

Here's the honest part - the weather meta isn't a secret anymore

The only real question is how long these markets stay this soft

The forecasts I use to spot these come from a tool a friend built - it tracks temperature, rainfall, sudden forecast shifts, and flags "stable cities" where pricing stays predictable

Signals, not guarantees - it points, you still read the board and take the trade
